# Agenda

- **OTDR Terminology**
- **OTDR Basics**
  - » Distance Measurements
  - » Loss Measurements
  - » Reflectance Measurements
  - » ORL Measurements
- **OTDR Setups**
  - » IOR
  - » Backscatter coefficient
  - » Wavelength
  - » Range
  - » Resolution
  - » Pulse width
  - » Number of averages
- **Anritsu MT9083x Access Master OTDR**

# OTDR Terminology

## *Trace Basics*

# OTDR Terminology

## *Locating the end of the fibre*

# OTDR Terminology

## *Dynamic Range*

- Measured in dB. Typical range is 20-50dB
- Describes how much loss an OTDR can measure in a fibre, which in turn describes how long of a fibre can be measured
- Directly related to Pulse Width: larger pulse widths provide larger dynamic range
- Increase by using **longer PW** and by decreasing noise thru **averaging**

# OTDR Terminology

## *Dynamic Range*

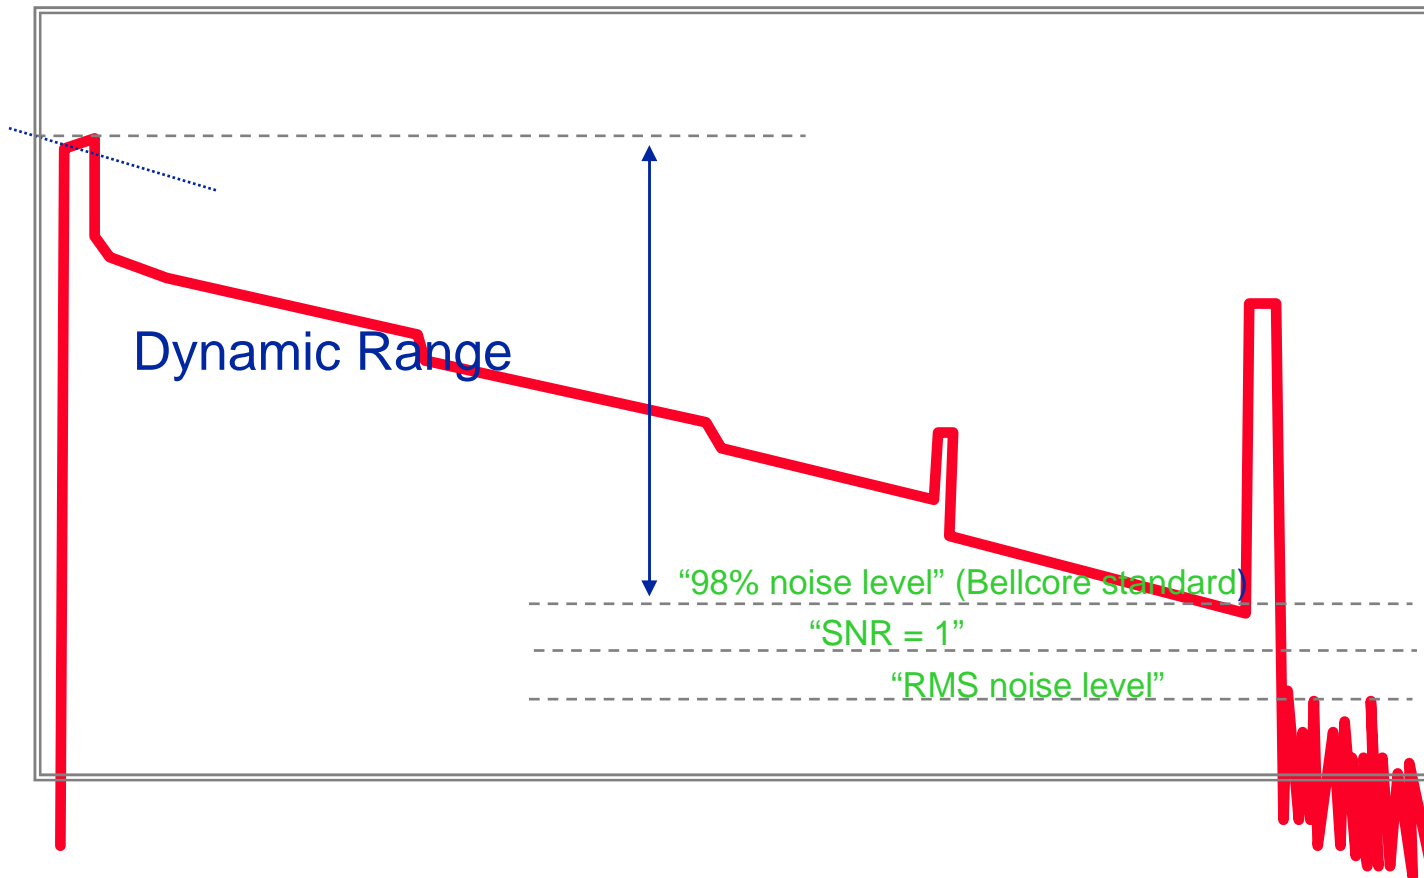

- **Converting Dynamic Range into Distance**

- » Can only be done on a straight piece of glass (no events)
- » Need to know the dB/Km loss for each wavelength to be tested.
- » Need to know the dynamic range at each wavelength.
- » Distance =  $\frac{\text{Dynamic Range}}{\text{dB/Km}}$

dB/Km

# OTDR Terminology

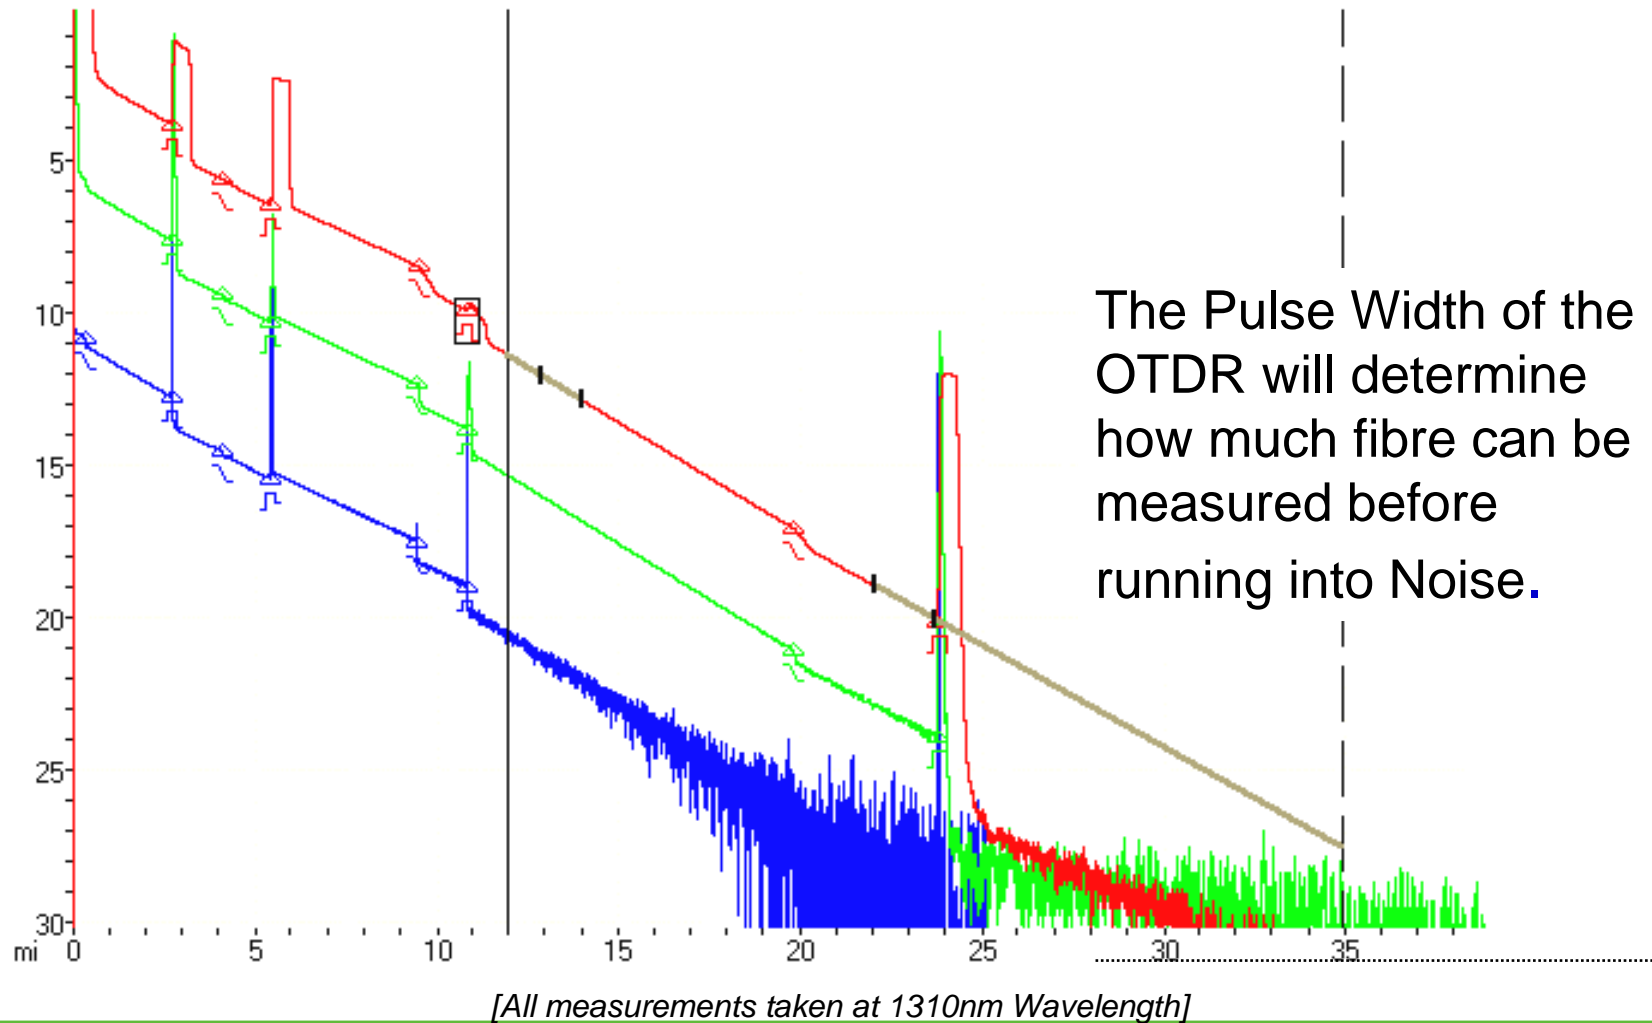

## *Dynamic Range*

# OTDR Terminology

## *Dynamic Range Examples*

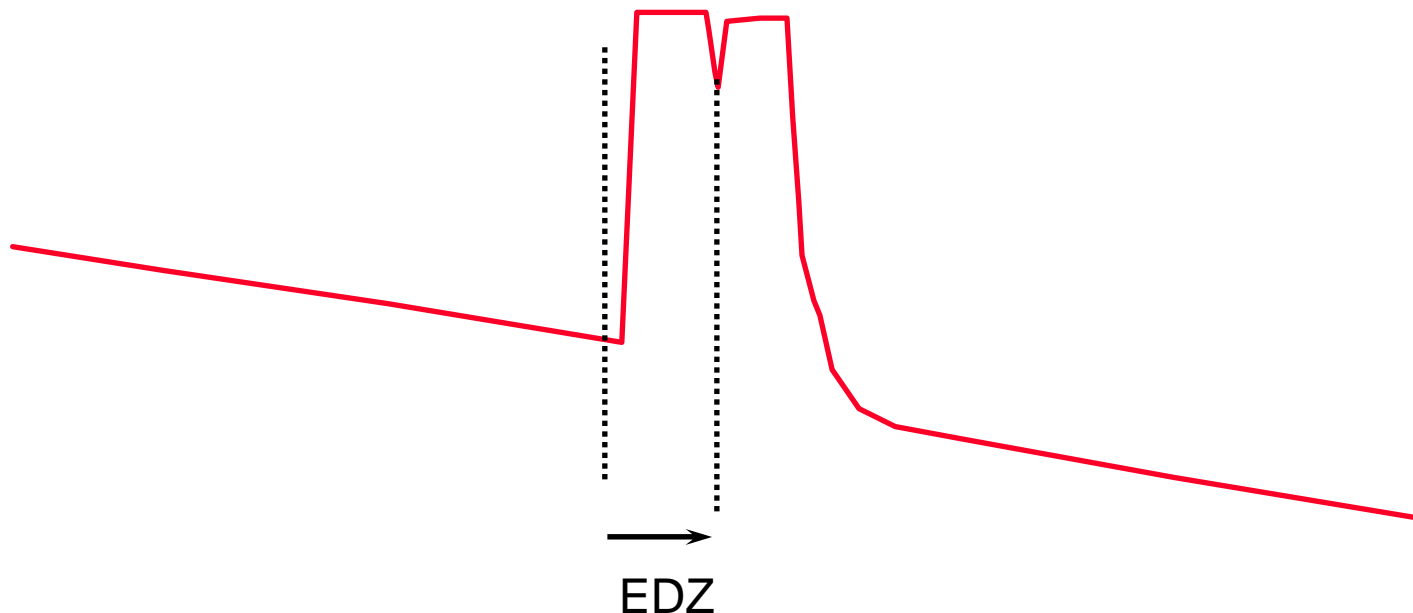

# OTDR Terminology

## *Dead zones*

- Specified as a DISTANCE
- Determines how CLOSE to OTDR you can detect and measure a splice loss
- Determines how CLOSE TOGETHER two events (splices) can be measured
- Directly related to PULSE WIDTH: larger pulse widths produce larger dead zones

# OTDR Terminology

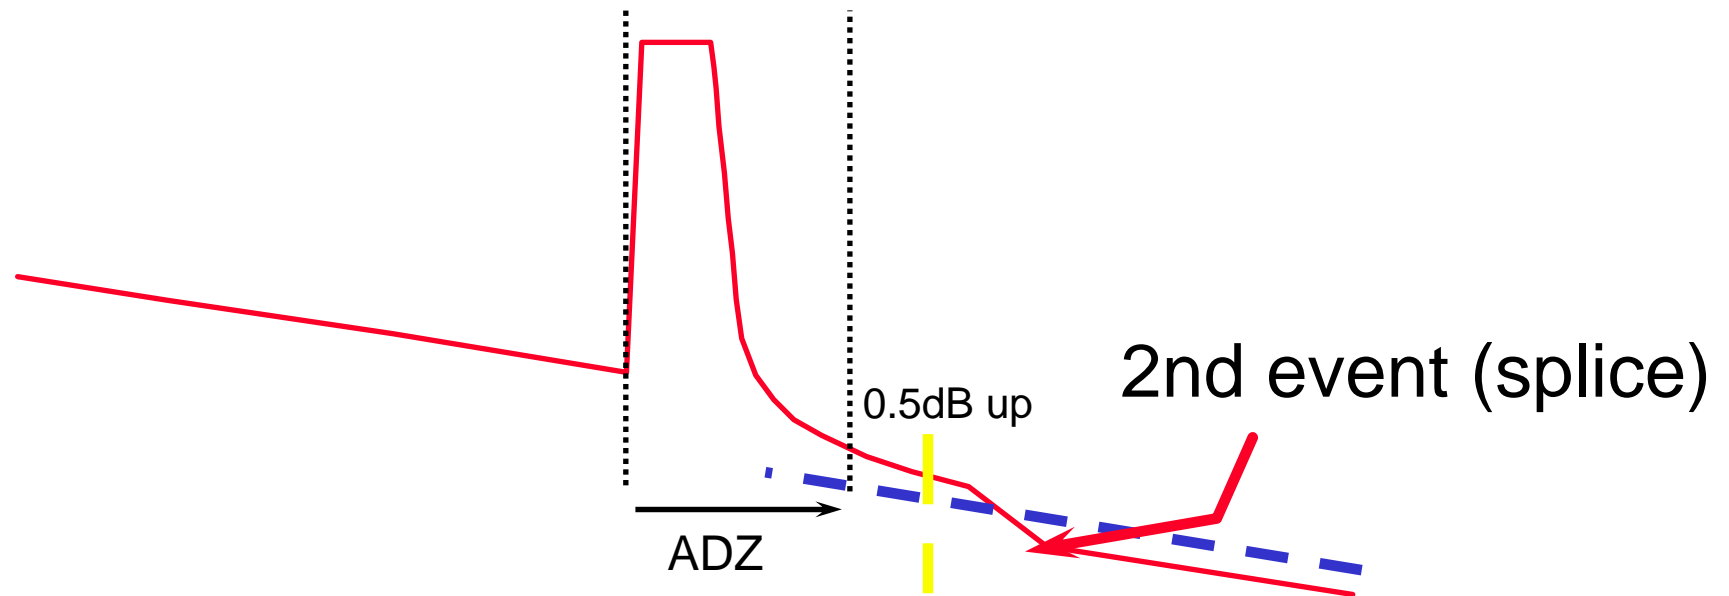

## *Reflective or Event Dead Zone*

The distance from the start of a reflective event until you can detect another reflective event. Measured at 1.5dB below the peak of the initial reflection.

# OTDR Terminology

## *Non-Reflective or Attenuation Dead Zone*

The distance from the start of a reflective event until you can **measure the loss** of another event. Measured at 0.5dB up from the backscatter level after the reflection.

# OTDR Basics

## Measurements

### Distance measurements

Locate End  
Locate Splice

### Loss measurements

Measure splice losses  
Measure end to end

### Reflectance measurements

Measure Reflectance  
Measure ORL

# OTDR Basics

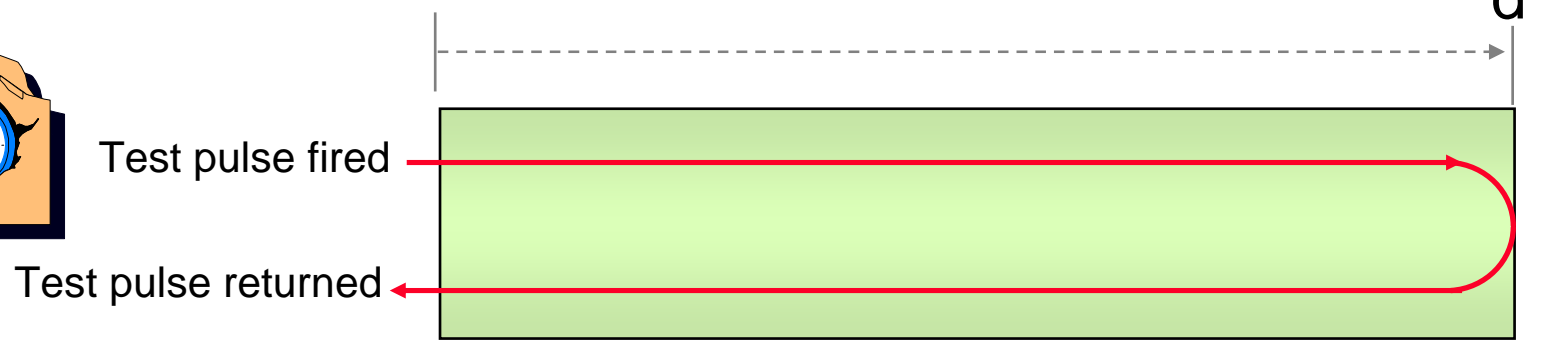

## Distance Measurements

$$d = \frac{t C}{2 n}$$

Must divide by two to get one way elapsed time.

If "n" is incorrect, then the distance measured will also be wrong!!

d = distance      c = speed of light in a vacuum  
t = elapsed time      n = Index of Refraction

# OTDR Basics

## *Distance Measurements*

- Measuring distance
  - » To calculate the speed of light, the OTDR must know the Index of Refraction (IOR).
  - » The IOR is a ratio between the speed of light in a vacuum and the speed of light in a fibre.
  - » The IOR is obtained from the fibre manufacturer, entered into the OTDR by the user and must be accurate.

# OTDR Basics

## *Loss Measurements*

- OTDRs *measure* backscatter

OTDRs *calculate* loss

**OTDR Basics**

**Distance Measurements**

**OTDR calculates loss by comparing backscatter levels to determine loss between points in fibre**

# OTDR Basics

## Loss Measurements

**Backscatter is directly related** to the power of the test pulse. As the test pulse power decreases, so does the backscatter power.

The **difference** in strength between two points of backscatter is directly proportional to the difference in strength between the test pulse at the same two points.

# OTDR Basics

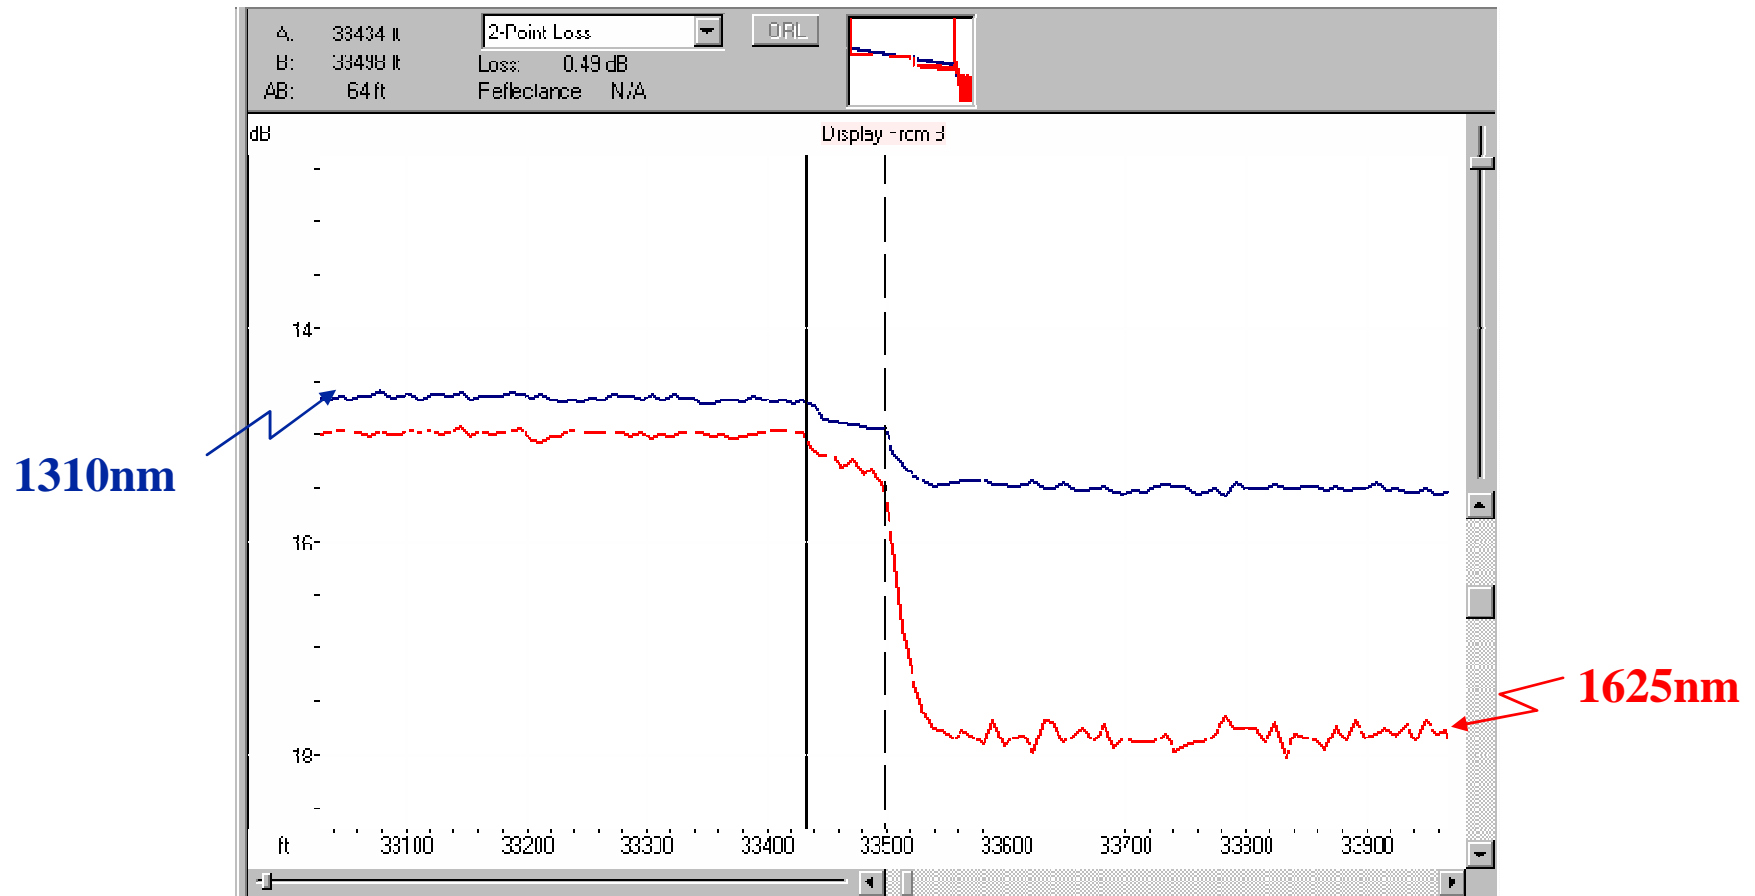

## *Loss Measurements*

- Different test wavelengths exhibit different loss characteristics.
  - » 850nm - *extremely susceptible* to Rayleigh scattering loss
  - » 1244nm - *very susceptible* to hydrogen absorption and Rayleigh scattering loss
  - » 1300nm - *very susceptible* to Rayleigh scattering loss
  - » 1310nm - *susceptible* to Rayleigh scattering loss
  - » 1550nm - *very susceptible* to macrobending loss
  - » 1625nm - *extremely susceptible* to macrobending loss

# OTDR Basics

## Loss Measurements

Different wavelengths respond very differently to various losses.

# OTDR Basics

## Loss Measurements

**IMPORTANT**

### Splice Loss

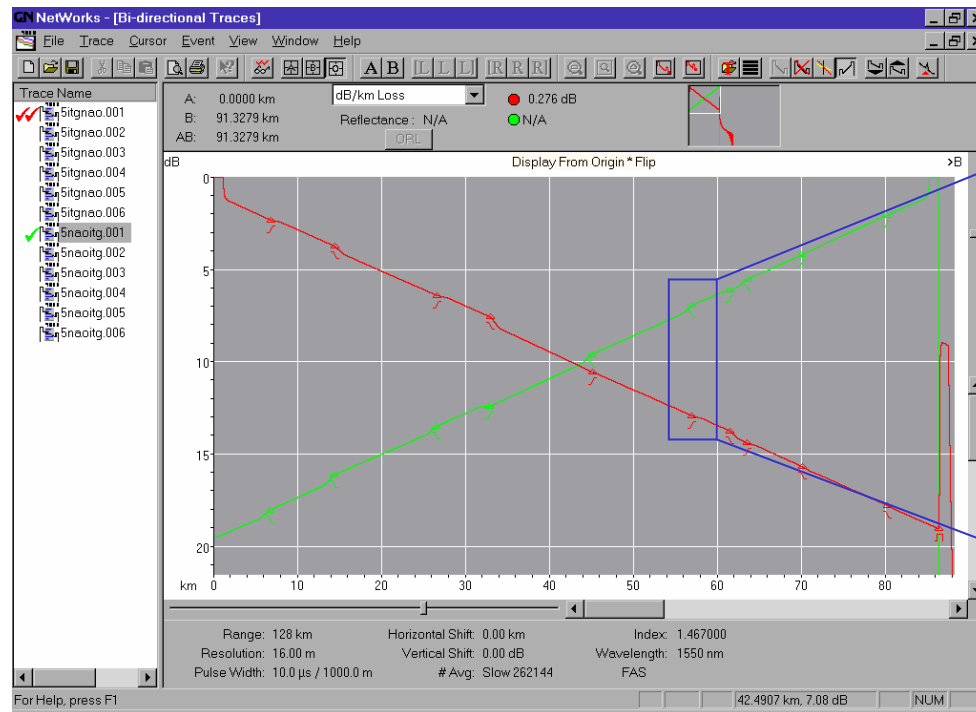

For proper splice loss measurement, the linear backscatter after the event must be extrapolated to the beginning of the event to account for the width of the test pulse. This is accomplished with LSA cursors.

# OTDR Basics

## Bi-directional Loss Measurements

The most accurate method of OTDR splice loss measurement entails bi-directional OTDR traces. The fibre is shot from both ends and individual event splice losses are averaged together to account for gainers.

# OTDR Basics

## Reflectance Measurements

- OTDRs calculate event reflectance by comparing the backscatter level just before an event to the backscatter level during an event.

Some events cause **reflections**, or “spikes” of returned light at the splice point or fibre end

# OTDR Basics

## ORL Measurements

**Optical Return Loss (ORL)** is measured in +dB and represents the sum of all individual reflectances within a fibre span.

# OTDR Basics

## *ORL Measurements*

ORL is *calculated* as the total amount of light returning from the area between the cursors below the trace line to the noise level.  
It includes total Backscatter and all Reflections.

# OTDR Basics

## *ORL Measurements*

- **Pulsed Light vs. Continuous wave**
  - » OTDR affected by Noise, distance and Pulse width
  - » Deadzones prevent OTDR from measuring small reflections that often follow large reflective events.
- **OTDR = evaluated ORL Measurement**
- **CMA50 = True ORL Measurement**
- **Accuracy**
  - » CMA50  $\pm 0.5\text{dB}$
  - » OTDR  $\pm 4\text{dB}$
  - » CMA5000 SMART ORL  $\pm 1\text{dB}$

# OTDR Setups

- » IOR
- » Backscatter coefficient
- » Wavelength
- » Range
- » Resolution
- » Pulsethickness
- » Number of averages

# Setting Up The OTDR

## *Fibre Details*

- **IOR**
  - » obtain from fibre manufacturer, dial in on OTDR
- **Backscatter coefficient**
  - » obtain from fibre manufacturer, dial in on OTDR

# Setting Up the OTDR

## Range

- Must be at least 25% greater than the fibre under test.
- There is valuable information in the noise floor which must be measured.

# Setting Up the OTDR

## *Resolution*

*Typically begin with the lowest resolution (highest number) possible.*

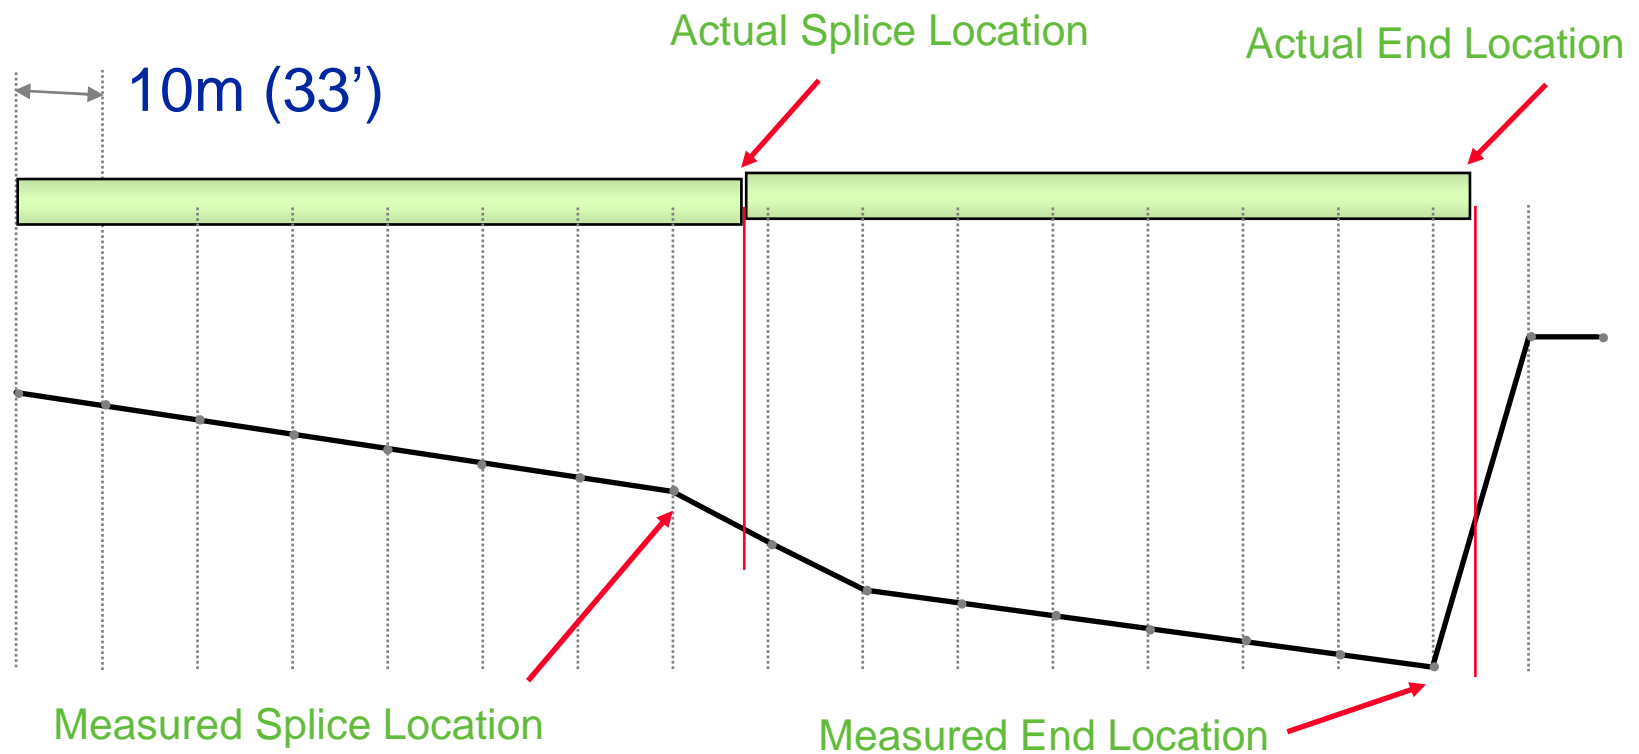

**Pros** - *much* faster acquisition time, smaller trace file size

**Cons** - minimal degradation in accuracy of measurements

# Setting Up the OTDR

## Resolution

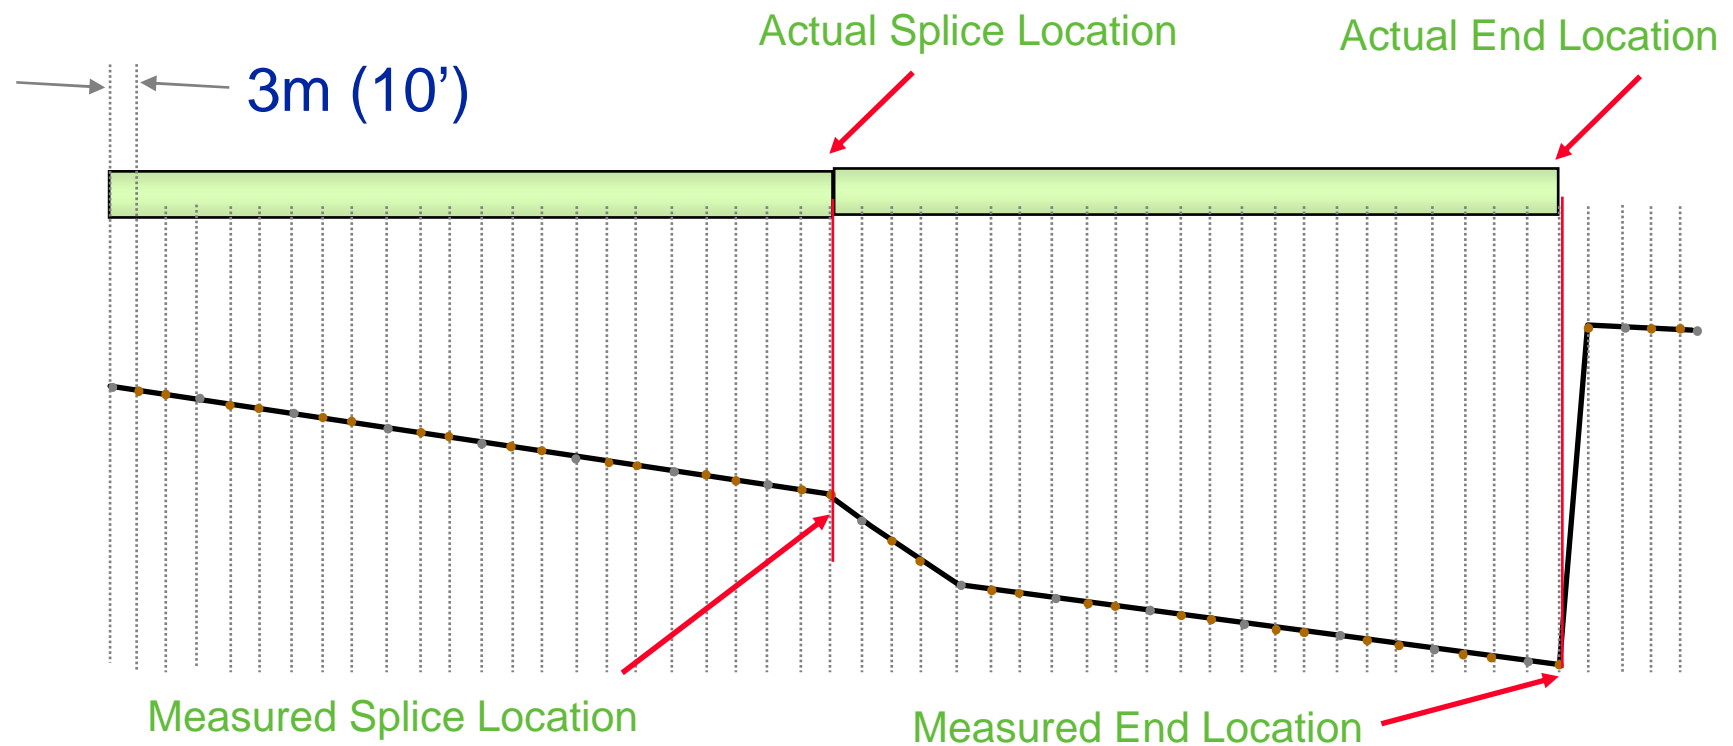

### Low Density (long DPS)

# Setting Up the OTDR

## Resolution

### High Density (short DPS)

# Setting Up the OTDR

## *Pulse Width*

### Controls Dynamic Range and Dead Zone

A light pulse from the OTDR travels along inside the fibre like water through a pipe.

10ns = 1 meter = 3 feet

100ns = 10 meters = 33 feet

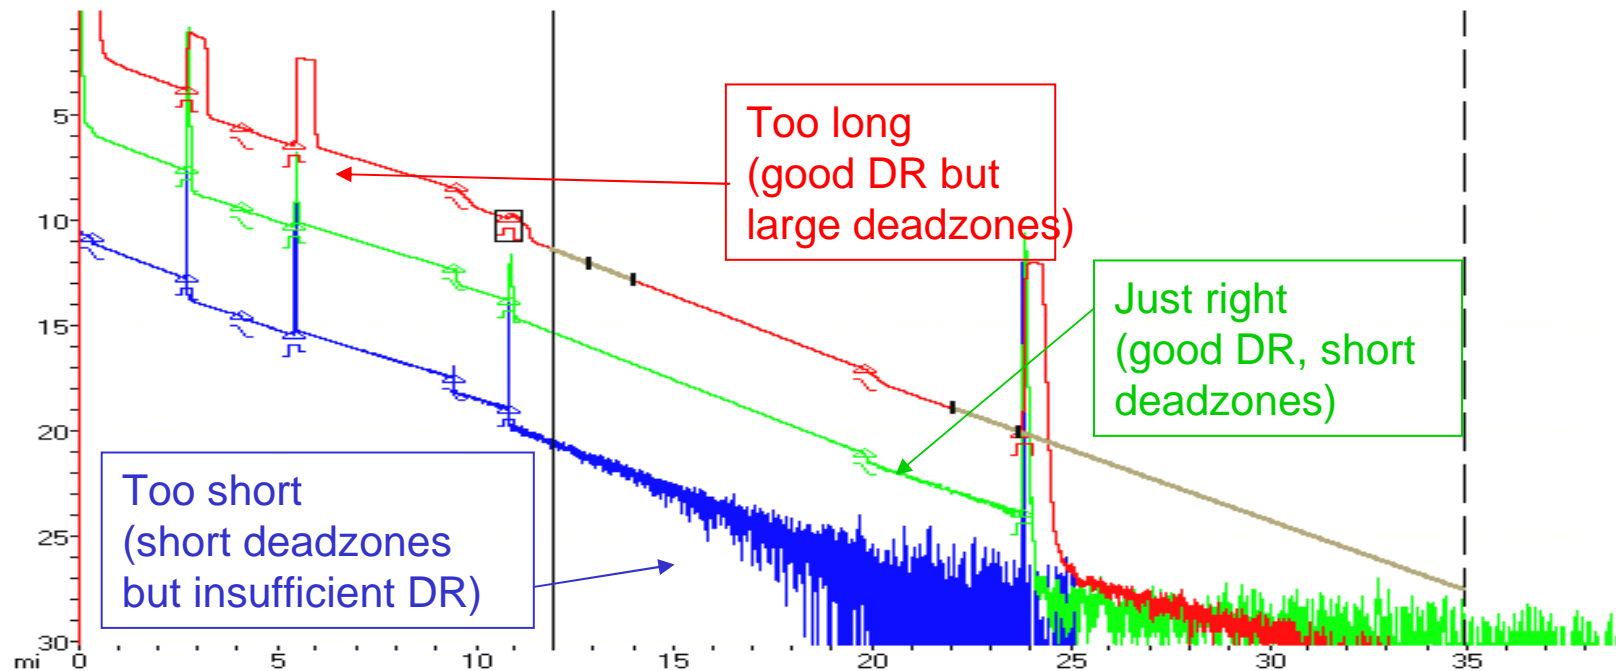

10,000ns = 1,000 meters = 3,281 feet

# Setting Up the OTDR

## *Pulse Width*

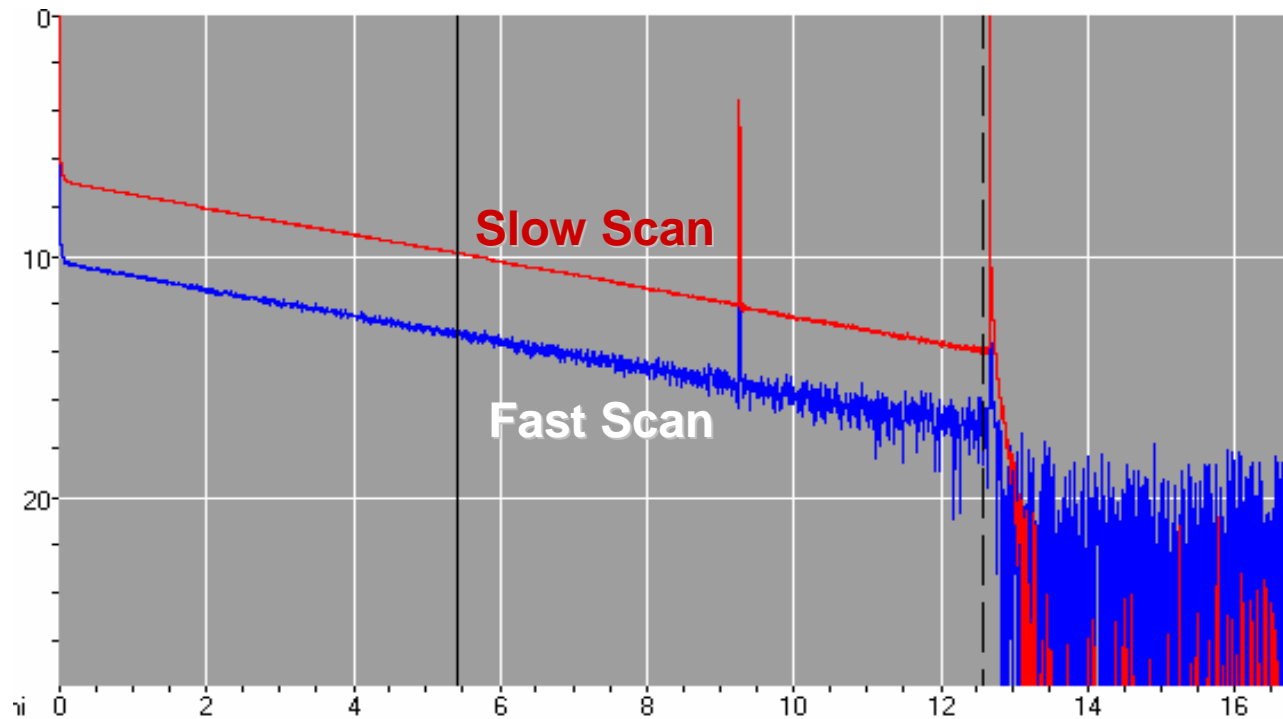

- The single most important parameter
- Use the shortest pulse width which still provides sufficient dynamic range

# Setting Up the OTDR

## Averaging

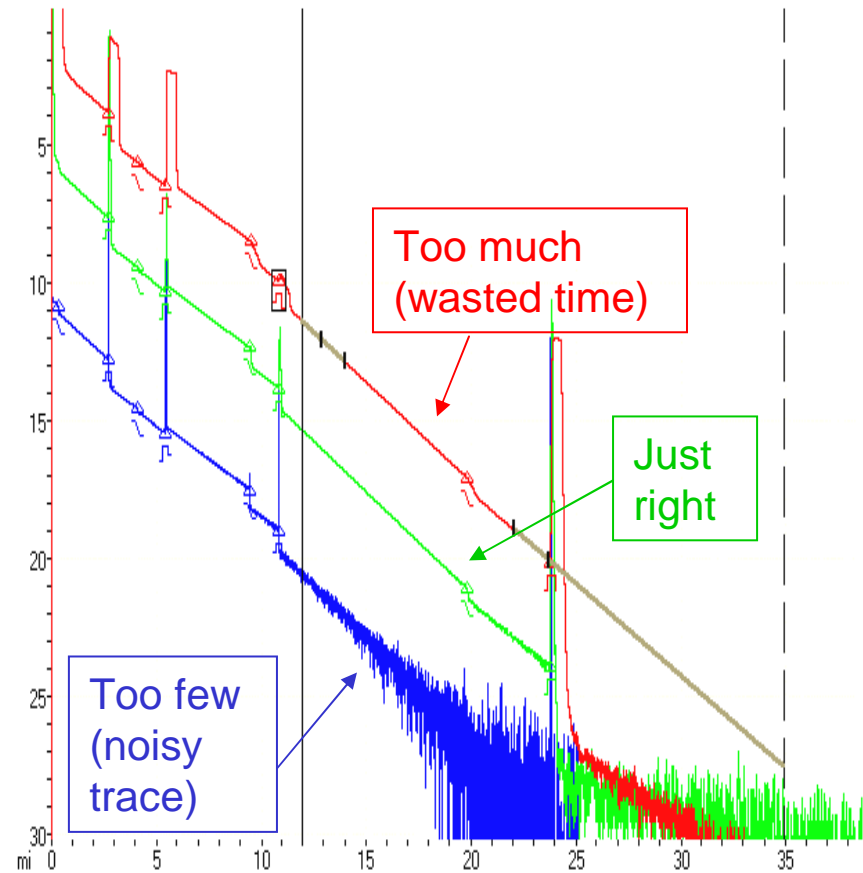

Noise shows up as variations in the trace line. Longer averaging times reduce the noise level.

# Setting Up the OTDR

## *Averaging*

- **Number of Averages**
  - » The number of averages will contribute to the amount of noise present on a trace.
  - » Use the least number of averages which still produces clean, useable traces.

**Thank You**
